

# Acute Coronary Syndrome

Luke Seibolt, MD

PGY-6 Cardiology Fellow

# AHD – Acute Coronary Syndrome Objectives

1. Describe the pathophysiology of STEMI and NSTEMI. Specifically describe the difference between type 1 and type 2 MI
2. Describe the TIMI and GRACE score for NSTEMI
3. Know the appropriate management of STEMI and NSTEMI based on ACC/AHA guidelines
4. Describe the abnormal values for high-sensitivity troponin assays and how to use the new assay in the evaluation of a patient with chest pain who rules out, rules in and is in the indeterminant range for this biomarker

# Case #1 – July 9, 2019 @ 17:00

65 yo male with PMHx HTN, HLP and hx Tobacco abuse who presented 60 minutes after onset of chest pain. 8/10 substernal chest heaviness with radiation to neck while mowing the lawn. Symptoms spontaneously resolved with rest. Associated dizziness, nausea and diaphoresis. Chest pain free in ER.

VS: BP 144/88, HR 60, 97% RA

EKG: to follow

Labs: HS Troponin 44, BNP <10, Cr 0.98, Hb 15.3, Plts 209, INR 1.0

# ER First Call:

65 year old male PMHx HTN, HLP, Hx Tobacco use presented after chest pain with mowing. Chest pain free in ER.

-VS stable

-EKG no ischemia

-Labs: HS Troponin 44

- A. NSTEMI-ACS – Start ACS protocol, await repeat HS troponin
- B. STEMI – Activate cardiac cath lab
- C. Recommend Observation admission, no ACS protocol
- D. DC home – Chest pain free, troponin indeterminate, EKG normal

# Case #1 – July 9, 2019 @ 19:00

Web page –

Dr. Intern, **repeat HS Troponin 330**. What orders?

BP 130/84, HR 64

Patient remains chest pain free, asking for dinner, wants to know when he can go home to let his dog out?

# Case #1

65 year old male PMHx HTN, HLP, Hx Tobacco use presented after chest pain with mowing. Chest pain free in ER.

-VS stable

-EKG no ischemia

-Labs: HS Troponin 44 -> 330

- A. NSTEMI-ACS – ACS protocol with immediate invasive strategy
- B. NSTEMI-ACS – ACS protocol with early invasive vs ischemia-guided strategy
- C. STEMI – Activate cardiac cath lab
- D. Continue Observation admission, consult cardiology in AM
- E. DC home – Patient has to let his dog out

# Case #1

Appropriately started ACS protocol...what is initial ACS protocol?

- A. ASA 81mg , GpIIb/IIIa inhibitor, full dose AC, pravastatin, amlodipine
- B. ASA 324mg, clopidogrel 600mg, full dose AC, HI statin, metoprolol
- C. ASA 324mg, clopidogrel 75mg, DVT prophylaxis dose AC, No statin
- D. ASA 324mg, clopidogrel 600mg, GPIIb/IIIa inhibitor, full dose AC, type and cross with 2u pRBC on hold

# NSTE-ACS Therapy

- Initial treatment – MONA\*\*
- ABCs:
  - Aspirin, Anti-platelet, Anti-thrombotic, Anti-anginal, ACEi/ARB
  - Beta-blocker
  - Cholesterol (statin)

# Anti-thrombotic therapy

Agent	Mechanism	Pro	Con
UFH	Inhibits Xa and thrombin (via ATIII)	Easy to assess effect, quick on/quick off	Variable response, HIT, lab draws
LMWH	Inhibits XA and thrombin (via ATIII)	Ease of use, less platelet activation	Measuring effect, HIT
Bivalirudin	Direct thrombin inhibitor	Easy to assess affect, short half life, no HIT	ONLY FOR INVASIVE APPROACH
Fondaparinaux	Indirect Xa inhibition	Once daily	Once daily, only for conservative tx

# Anti-platelet

- Aspirin: 325 mg load, 81 mg daily
- P2Y<sub>12</sub> Inhibitors:
  - Thienopyridines (indirect inhibitors):
    - *Clopidogrel (Plavix)*: 300 or 600 mg load, 75 mg daily
    - Prasugrel (Effient): 60 mg load, 10 mg daily
  - Direct inhibitors:
    - Ticagrelor (Brilinta): 180 mg load, 90 mg BID
    - Cangrelor (Kengreal)

# Anti-anginal

- Nitroglycerin
  - No mortality benefit
  - Mechanism: selective coronary vasodilation
  - CAUTION: Decrease pre-load
    - Do not use in pre-load dependent RV infarct
    - Careful if severe AS

# Medical Therapy

Therapy	Indications	Dose/Administration	Avoid/Caution
Beta-Receptor Antagonists	<ul style="list-style-type: none"><li>• Oral: All patients without contraindication</li><li>• IV: Patients with refractory hypertension or ongoing ischemia without contraindication</li></ul>	<p>Individualize:</p> <ul style="list-style-type: none"><li>• Metoprolol tartrate 25 to 50 mg every 6 to 12 h orally, then transition over next 2 to 3 d to twice-daily dosing of metoprolol tartrate or to daily metoprolol succinate; titrate to daily dose of 200 mg as tolerated</li><li>• Carvedilol 6.25 mg twice daily, titrate to 25 mg twice daily as tolerated</li><li>• Metoprolol tartrate IV 5 mg every 5 min as tolerated up to 3 doses; titrate to heart rate and BP</li></ul>	<ul style="list-style-type: none"><li>• Signs of HF</li><li>• Low output state</li><li>• Increased risk of cardiogenic shock</li><li>• Prolonged first-degree or high-grade AV block</li><li>• Reactive airways disease</li></ul>

ACE Inhibitors	<ul style="list-style-type: none"> <li>For patients with anterior infarction, post-MI LV systolic dysfunction (EF <math>\leq</math>0.40) or HF</li> <li>May be given routinely to all patients without contraindication</li> </ul>	<p>Individualize:</p> <ul style="list-style-type: none"> <li>Lisinopril 2.5 to 5 mg/d to start; titrate to 10 mg/d or higher as tolerated</li> <li>Captopril 6.25 to 12.5 mg 3 times/d to start; titrate to 25 to 50 mg 3 times/d as tolerated</li> <li>Ramipril 2.5 mg twice daily to start; titrate to 5 mg twice daily as tolerated</li> <li>Trandolapril test dose 0.5 mg; titrate up to 4 mg daily as tolerated</li> </ul>	<ul style="list-style-type: none"> <li>Hypotension</li> <li>Renal failure</li> <li>Hyperkalemia</li> </ul>
ARB	<ul style="list-style-type: none"> <li>For patients intolerant of ACE inhibitors</li> </ul>	<ul style="list-style-type: none"> <li>Valsartan 20 mg twice daily to start; titrate to 160 mg twice daily as tolerated</li> </ul>	<ul style="list-style-type: none"> <li>Hypotension</li> <li>Renal failure</li> <li>Hyperkalemia</li> </ul>
Statins	<ul style="list-style-type: none"> <li>All patients without contraindications</li> </ul>	<ul style="list-style-type: none"> <li>High-dose atorvastatin 80 mg daily</li> </ul>	<ul style="list-style-type: none"> <li>Caution with drugs metabolized via <i>CYP3A4</i>, fibrates</li> <li>Monitor for myopathy, hepatic toxicity</li> <li>Combine with diet and lifestyle therapies</li> <li>Adjust dose as dictated by targets for LDL cholesterol and non-HDL cholesterol reduction</li> </ul>

# NSTEMI Summary

- Serial ECG and cardiac biomarkers
- ABCs
  - ASA 325mg then 81mg QD
  - P2Y12 Inhibitor
    - Clopidogrel 600mg or 300mg then 75mg QD
    - Ticagrelor 180mg then 90mg BID
  - Anti-thrombotic (UFH)
  - Anti-anginal (SL NTG or NTG drip)
  - Beta-blocker (PO Metoprolol)
  - Cholesterol (High intensity Rosuvastatin or Atorvastatin)

# P2Y<sub>12</sub> Inhibitors

Table 1. P2Y<sub>12</sub> Inhibitors Currently in Clinical Use After Percutaneous Coronary Intervention

	Ticlopidine	Clopidogrel	Prasugrel	Ticagrelor
Class	Thienopyridine	Thienopyridine	Thienopyridine	Cyclopentyl-triazolo-pyrimidine
Pharmacology	Highly CYP-dependent conversion to prodrug	Highly CYP-dependent conversion to prodrug	Requires conversion to prodrug (less CYP dependent)	Directly acting inhibitor
Potency of platelet inhibition	+	+	++	++
Time to peak platelet inhibition <sup>24</sup>	3-4 d	4-5 h (300 mg) 2-3 h (600 mg)	2-4 h	2-4 h
Dosing, daily	Twice	Once	Once	Twice
Time required for anti-platelet effect to dissipate, days	5	5	7	5
Cost for 1 mo, \$	≈45.00 <sup>a</sup>	14.50 (generic) <sup>a</sup> 218.87 (Plavix) <sup>b</sup>	218.52 <sup>b</sup>	260.78 <sup>b</sup>

# Case #1 Recap: July 9, 2019 @ 21:00, 12E

65 year old male PMHx HTN, HLP, Hx Tobacco use presented after **chest pain with mowing**. Remains chest pain free.

- BP, HR stable.
- EKG (initial and repeat) no ischemia
- Labs: **HS Troponin 44 -> 330**
- Started on ACS therapy including:
  - ASA 324mg
  - Clopidogrel 600mg
  - Heparin drip (bolus + infusion)
  - Atorvastatin 80mg
  - Metoprolol 25mg BID

65 year old male PMHx HTN, HLP, Hx Tobacco use presented after chest pain with mowing. Chest pain free in ER.

-VS stable

-EKG no ischemia

-Labs: HS Troponin 44

# What's next?

- A. Ischemia driven strategy - Order Stress test for in the morning
- B. Early invasive strategy - NPO at midnight for coronary angiogram in the morning
- C. Delayed invasive strategy – Monitor clinically, coronary angiogram within 72hrs
- D. Medical management – continue heparin drip for 48 hours and discharge home on NSTEMI therapy

# Early Invasive and Ischemia: Guided Strategies

Recommendations	COR	LOE
An <b>urgent/immediate invasive strategy</b> (diagnostic angiography with intent to perform revascularization if appropriate based on coronary anatomy) is indicated in patients (men and women) with NSTEMI-ACS who have <b>refractory angina or hemodynamic or electrical instability</b> (without serious comorbidities or contraindications to such procedures).	I	A
An <b>early invasive strategy</b> (diagnostic angiography with intent to perform revascularization if appropriate based on coronary anatomy) is indicated in <b>initially stabilized</b> patients with NSTEMI-ACS (without serious comorbidities or contraindications to such procedures) who have an <b>elevated risk for clinical events</b> .	I	B

# Early Invasive and Ischemia: Guided Strategies (cont'd)

Recommendations	COR	LOE
It is reasonable to choose <b>an early invasive strategy</b> (within 24 hours of admission) <b>over a delayed invasive strategy</b> (within 25 to 72 hours) for <b>initially stabilized high-risk patients</b> with NSTEMI-ACS. For those not at high/intermediate risk, a delayed invasive approach is reasonable.	IIa	B
<b>In initially stabilized patients, an ischemia-guided strategy</b> may be considered for patients with NSTEMI-ACS (without serious comorbidities or contraindications to this approach) <b>who have an elevated risk for clinical events.</b>	IIb	B
The decision to implement an <b>ischemia-guided strategy</b> in initially stabilized patients (without serious comorbidities or contraindications to this approach) <b>may be reasonable after considering clinician and patient preference.</b>	IIb	C

## Factors Associated With Appropriate Selection of Early Invasive Strategy or Ischemia-Guided Strategy in Patients With NSTEMI-ACS

<b>Immediate invasive (within 2 h)</b>	Refractory angina
	Signs or symptoms of HF or new or worsening mitral regurgitation
	Hemodynamic instability
	Recurrent angina or ischemia at rest or with low-level activities despite intensive medical therapy
	Sustained VT or VF
<b>Ischemia-guided strategy</b>	Low-risk score (e.g., TIMI [0 or 1], GRACE [ $<109$ ])
	Low-risk Tn-negative
	Patient or clinician preference in the absence of high-risk features
<b>Early invasive (within 24 h)</b>	GRACE risk score $>140$
	Temporal change in Tn
	New or presumably new ST depression
<b>Delayed invasive (within 25–72 h)</b>	None of the above but diabetes mellitus
	Renal insufficiency (GFR $<60$ mL/min/1.73 m <sup>2</sup> )
	Reduced LV systolic function (EF $<0.40$ )
	Early postinfarction angina
	PCI within 6 mo
	Prior CABG
	GRACE risk score 109–140; TIMI score $\geq 2$

## Factors Associated With Appropriate Selection of Early Invasive Strategy or Ischemia-Guided Strategy in Patients With NSTEMI-ACS

<b>Immediate invasive (within 2 h)</b>	<b>Refractory angina</b>
	<b>Signs or symptoms of HF or new or worsening mitral regurgitation</b>
	<b>Hemodynamic instability</b>
	<b>Recurrent angina or ischemia at rest or with low-level activities despite intensive medical therapy</b>
	<b>Sustained VT or VF</b>
<b>Ischemia-guided strategy</b>	Low-risk score (e.g., TIMI [0 or 1], GRACE [ $<109$ ])
	Low-risk Tn-negative
	Patient or clinician preference in the absence of high-risk features
<b>Early invasive (within 24 h)</b>	<b>GRACE risk score <math>&gt;140</math></b>
	<b>Temporal change in Tn</b>
	<b>New or presumably new ST depression</b>
<b>Delayed invasive (within 25–72 h)</b>	<b>None of the above but diabetes mellitus</b>
	<b>Renal insufficiency (GFR <math>&lt;60</math> mL/min/1.73 m<sup>2</sup>)</b>
	<b>Reduced LV systolic function (EF <math>&lt;0.40</math>)</b>
	Early postinfarction angina
	PCI within 6 mo
	Prior CABG
	GRACE risk score 109–140; TIMI score $\geq 2$

# Basics...Start from the beginning:

- Clinical story
- Physical exam
- Risk factors / Risk scores
- Cardiac biomarkers
- ECG
- Imaging (Echo)

# Diagnosis – Clinical Story

- Anginal chest pain
  1. Substernal
  2. Brought on by exertion or emotional stress
  3. Relieved by rest or nitroglycerin\*

[◀ PREV ARTICLE](#) | [THIS ISSUE](#) | [NEXT ARTICLE ▶](#)

ARTICLES | 16 DECEMBER 2003

## Chest Pain Relief by Nitroglycerin Does Not Predict Active Coronary Artery Disease

*Charles A. Henrikson, MD, MPH; Eric E. Howell, MD; David E. Bush, MD; J. Shawn Miles, MD; Glenn R. Meininger, MD; Tracy Friedlander; Andrew C. Bushnell, MD; Nisha Chandra-Strobos, MD*

### Results:

- Nitroglycerin relieved chest pain in 39% of patients (181/459) admitted through the ED who received nitro from EMS or ER staff
- 35% had chest pain relief with nitro in patients with active coronary artery disease as cause of chest pain
- 41% had chest pain relief with nitro in patients without active coronary artery disease as cause of chest pain

**Conclusion:** In a general population admitted for chest pain, relief of pain after nitro treatment does not predict active coronary artery disease and should not be used to guide diagnosis.

# Diagnosis – Clinical Story

- Anginal chest pain
  1. Substernal
  2. Brought on by exertion or emotional stress
  3. Relieved by rest or nitroglycerin\*
- Typical Angina – meets all 3 criteria
- Atypical Angina – meets 2 of 3 criteria
- Non-anginal CP – meets 0-1 of 3 criteria

### Comparing pretest likelihood of CAD in low-risk symptomatic patients with high-risk symptomatic patients (Duke Database)

Age (year)	Nonanginal chest pain		Atypical angina		Typical angina	
	Men	Women	Men	Women	Men	Women
35	3-35	1-19	8-59	2-39	30-88	10-78
45	9-47	2-22	21-70	5-43	51-92	20-79
55	23-59	4-21	45-79	10-47	80-95	38-82
65	49-69	9-29	71-86	20-51	93-97	56-84

Each value represents the percentage with significant CAD. The lowest (first) value of each range is the likelihood of CAD for a low-risk patient without diabetes mellitus, smoking, or hyperlipidemia. The highest (second) value of each range is the likelihood of CAD for a high-risk patient of the same age with diabetes mellitus, smoking, and hyperlipidemia. Both high- and low-risk patients have normal resting ECGs. If ST-T-wave changes or Q waves had been present, the likelihood of CAD would be higher in each entry of the table. This information was included in the 2012 ACCF/AHA/ACP/AATS/PCNA/SCAI/STS Guideline for the Diagnosis and Management of Patients With Stable Ischemic Heart Disease.<sup>[1]</sup>

# Physical Exam

- CAN BE NORMAL
- VS: BP in both arms (dissection)
- Signs of LV dysfunction: Rales, S3 gallop

**Risk factors**

Risk factors: HTN, hypercholesterolemia, DM, obesity (BMI >30 kg/m<sup>2</sup>), smoking (current, or smoking cessation ≤3 mo), positive family history (parent or sibling with CVD before age 65); atherosclerotic disease: prior MI, PCI/CABG, CVA/TIA, or peripheral arterial disease

- No known risk factors 0
- 1-2 risk factors +1
- ≥3 risk factors or history of atherosclerotic disease +2

---

**Initial troponin**

Use local assays and corresponding cutoffs

- ≤normal limit 0
- 1-3× normal limit +1

**RESULT**

**0 points** Low Score

# Killip Class

Classification that categorizes patients with an acute MI based upon presence or absence of physical exam findings that suggest LV dysfunction and heart failure.

Class I	No evidence of heart failure
Class II	Findings consistent with mild to moderate HF
Class III	Overt pulmonary edema
Class IV	Cardiogenic shock

# Revisit Case #1

How would you risk stratify this patient?

TIMI RISK

GRACE SCORE

65 year old male PMHx HTN, HLP, Hx Tobacco use presented after chest pain with mowing. Chest pain free in ER.

-SBP 144, HR 60, Cr 0.98

-EKG no ischemia

-Labs: HS Troponin 44 -> 330

# Revisit Case #1

65 year old male PMHx HTN, HLP, Hx Tobacco use presented after chest pain with mowing. Chest pain free in ER.

-SBP 144, HR 60, Cr 0.98

-EKG no ischemia

-Labs: HS Troponin 44 -> 330

How would you risk stratify this patient?

TIMI RISK = 4

GRACE SCORE = 92

- A. Low Risk
- B. Intermediate Risk
- C. High Risk

# Case #1 – Next Day

Patient remained chest pain free overnight

BP and HR remain within normal limits

Peak HS Troponin 1,200

Cardiology consulted, taken to cath lab (early invasive)

## Case #2

72 year old male with PMHx tobacco abuse and DM2 admitted to Phoenix VA with **stuttering, substernal chest pressure**. Denies radiation of pain or associated dyspnea, palpitations, nausea or diaphoresis.

VS: BP 134/84, HR 74, 98% RA

Initial EKG: nonspecific inferior T wave changes

**Conventional troponin normal in ER**

Admit to 4C telemetry ward for ACS rule out

## Case #2

Receive page from RN Gloria on 4C that patient has developed **crushing substernal chest pain and diaphoretic.**

**VS: BP 98/56, HR 80, 100% 2L NC**

Repeat EKG to follow

17-Apr-2018 15:56:33

12 Lead, Standard Placement

## Case #2: What do you do?

- A. ACS protocol – This represents NSTEMI-ACS
- B. STEMI – Activate cardiac cath lab (No STEMI coverage at VA)
- C. STEMI – Transfer to PCI capable facility
- D. STEMI – Initiate thrombolytics
- E. Hope your senior resident was awake during this lecture last year

# Case #2

Which of the following combinations represents correct guideline recommended times for STEMI reperfusion therapy?

	PCI Capable Center FMC to Device (Banner)	PCI Non-Capable Center FMC to Device (Phoenix VA)	PCI Non-Capable Center FMC to Lytic (Prescott VA)
A	90 min	180 min	30 min
B	60 min	120 min	30 min
C	90 min	120 min	30 min
D	60 min	90 min	30 min

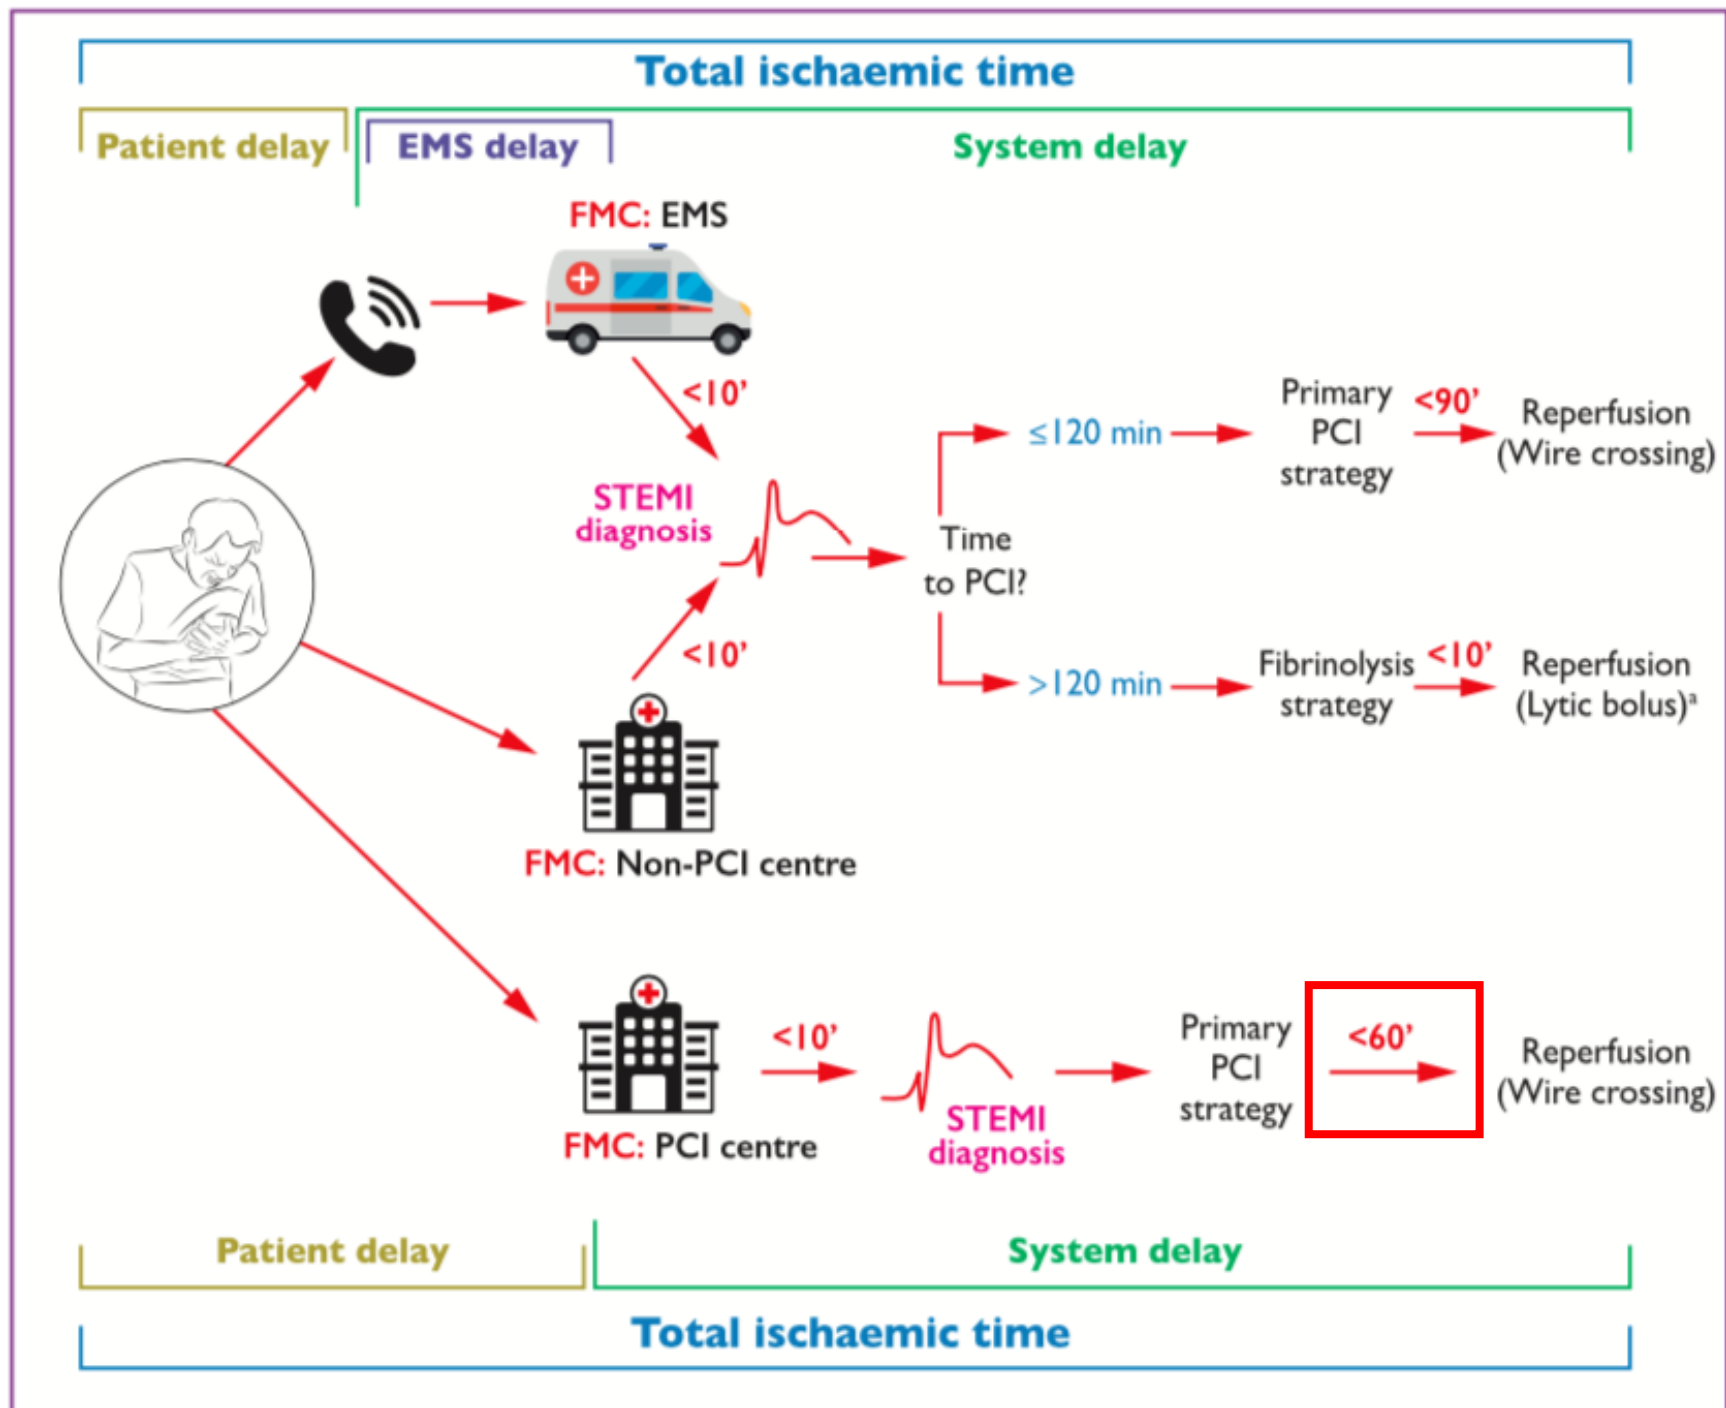

# Case #2

Which of the following combinations represents correct guideline recommended times for STEMI reperfusion therapy?

	PCI Capable Center FMC to Device (Banner)	PCI Non-Capable Center FMC to Device (Phoenix VA)	PCI Non-Capable Center FMC to Lytic (Prescott VA)
A	90 min	180 min	30 min
B	60 min	120 min	30 min
<b>C</b>	<b>90 min</b>	<b>120 min</b>	<b>30 min</b>
D	60 min	90 min	30 min

# Case #3

82 year old female with PMHx CKD III (baseline Cr 1.6), HFrEF (EF 35%) 2/2 NICM, DM2, HTN and hx breast cancer presents to ER with **weakness/fatigue, dyspnea on exertion and left sided chest pain.**

VS: **BP 88/50, HR 130, SpO2 86% RA**

Physical Exam:

Gen: **Old, frail appearing, pale, diaphoretic, asking for you to help her**

Resp: Rapid shallow breathing, poor air movement

CV: Irregular rate and rhythm, no murmur, 1+ BL LE edema

GI: Soft, distended abdomen, DRE + melena

EKG: To follow

Labs: Na 128, K 5.9, **Cr 3.3, Hb 5.2**, Plts 120, **Lactate 4.0, Troponin 450**

28-Jun-2019 1:05:30

12 Lead, Standard Placement

# Case #3

82 year old female presents to ER with weakness/fatigue, dyspnea on exertion and left sided chest pain.

VS: hypotensive, tachycardic, hypoxic

EKG: Afib with RVR

Labs: HS trop 450, Cr 3.3, Hb 5.2

- A. NSTEMI-ACS – start ACS protocol (DAPT + AC)
- B. Type I MI – Activate cardiac cath lab
- C. Type II MI – No ACS protocol, troponin elevation likely due to demand ischemia from rapid Afib and anemia with underlying CKD
- D. Type II MI – Start ASA and Plavix, no AC given anemia
- E. Hope your senior resident is back from continuity clinic

# Basics of coronary artery perfusion

## Supply and Demand

- What can decrease supply?
- What can increase demand?

	<b>Injury related to primary myocardial ischaemia</b>	
	Plaque rupture Intraluminal coronary artery thrombus formation	
	<b>Injury related to supply/demand imbalance of myocardial ischaemia</b>	
	Tachy-/brady-arrhythmias Aortic dissection or severe aortic valve disease Hypertrophic cardiomyopathy Cardiogenic, hypovolaemic, or septic shock Severe respiratory failure Severe anaemia Hypertension with or without LVH Coronary spasm Coronary embolism or vasculitis Coronary endothelial dysfunction without significant CAD	
	<b>Injury not related to myocardial ischaemia</b>	
Hypoten shock	Cardiac contusion, surgery, ablation, pacing, or defibrillator shocks Rhabdomyolysis with cardiac involvement Myocarditis Cardiotoxic agents, e.g. anthracyclines, herceptin	emia
	<b>Multifactorial or indeterminate myocardial injury</b>	
	Heart failure Stress (Takotsubo) cardiomyopathy Severe pulmonary embolism or pulmonary hypertension Sepsis and critically ill patients Renal failure Severe acute neurological diseases, e.g. stroke, subarachnoid haemorrhage Infiltrative diseases, e.g. amyloidosis, sarcoidosis Strenuous exercise	

## Universal definitions of myocardial injury and myocardial infarction

### Criteria for myocardial injury

The term myocardial injury should be used when there is evidence of elevated cardiac troponin values (cTn) with at least 1 value above the 99th percentile upper reference limit (URL)

### Criteria for acute myocardial infarction

The term acute myocardial infarction (MI) is used when there is detection of a rise and/or fall of cTn values with at least 1 value above the 99th percentile URL and with at least 1 of the following:

- Symptoms of myocardial ischemia
- New ischemic ECG changes
- Development of pathological Q waves
- Imaging evidence of new loss of viable myocardium or new regional wall motion abnormality
- Identification of a coronary thrombus by angiography including intracoronary imaging or by autopsy.\*

Postmortem demonstration of an atherothrombus in the artery supplying the infarcted myocardium, or a macroscopically large circumscribed area of necrosis with or without intramyocardial hemorrhage, meets the type 1 MI criteria regardless of cTn values.

### Criteria for coronary procedure-related myocardial infarction

Percutaneous coronary intervention

Coronary artery bypass grafting

Coronary procedure-related MI is defined as a rise and/or fall of cTn values with at least 1 value above the 99th percentile URL and with at least 1 of the following:

for type 5 MI of the 99th percentile URL and with at least 1 of the following:

- New ischemic ECG changes
- Development of new pathological Q waves
- Imaging evidence of new loss of viable myocardium or new regional wall motion abnormality
- Angiographic findings of new side-branch occlusion

Isolated development of pathological Q waves and rising but less than 20% of the preprocedural cTn level

Other types of 4 MI include

Postmortem demonstration of an atherothrombus in the artery supplying the infarcted myocardium, or a macroscopically large circumscribed area of necrosis with or without intramyocardial hemorrhage, meets the type 1 MI criteria regardless of cTn values.

### Criteria for prior or silent myocardial infarction

Any 1 of the following criteria

- Abnormal Q waves with or without symptoms in the absence of nonischemic causes.
- Imaging evidence of loss of viable myocardium in a pattern consistent with ischemic etiology.
- Patho-anatomical findings of a prior MI.

## Criteria for Type 1 MI

Detection of a rise and/or fall of cTn values with at least 1 value above the 99th percentile URL and with at least 1 of the following:

- Symptoms of acute myocardial ischemia;
- New ischemic ECG changes;
- Development of pathological Q waves;
- Imaging evidence of new loss of viable myocardium or new regional wall motion abnormality in a pattern consistent with an ischemic etiology;
- Identification of a coronary thrombus by angiography including intracoronary imaging or by autopsy.\*

cTn indicates cardiac troponin; ECG, electrocardiogram; URL, upper reference limit.

\*Postmortem demonstration of an atherothrombus in the artery supplying the infarcted myocardium, or a macroscopically large circumscribed area of necrosis with or without intramyocardial hemorrhage, meets the type 1 MI criteria regardless of cTn values.

the 99th percentile

chemia and with

mic etiology;

dence of an imbalance  
ients with symptoms  
riteria for type 3 MI.

e 4a MI and >10 times  
om the preprocedural  
seline value of >20%. In

icardial artery or graft,

f cTn values are elevated

ent.

# ST Elevation:

## ST-elevation

New ST-elevation at the J-point in 2 contiguous leads with the cut-point:  $\geq 1$  mm in all leads other than leads  $V_2-V_3$  where the following cut-points apply:  $\geq 2$  mm in men  $\geq 40$  years;  $\geq 2.5$  mm in men  $< 40$  years, or  $\geq 1.5$  mm in women regardless of age. \*

## ST-depression and T wave changes

New horizontal or downsloping ST-depression  $\geq 0.5$  mm in 2 contiguous leads and/or T inversion  $> 1$  mm in 2 contiguous leads with prominent R wave or R/S ratio  $> 1$ .

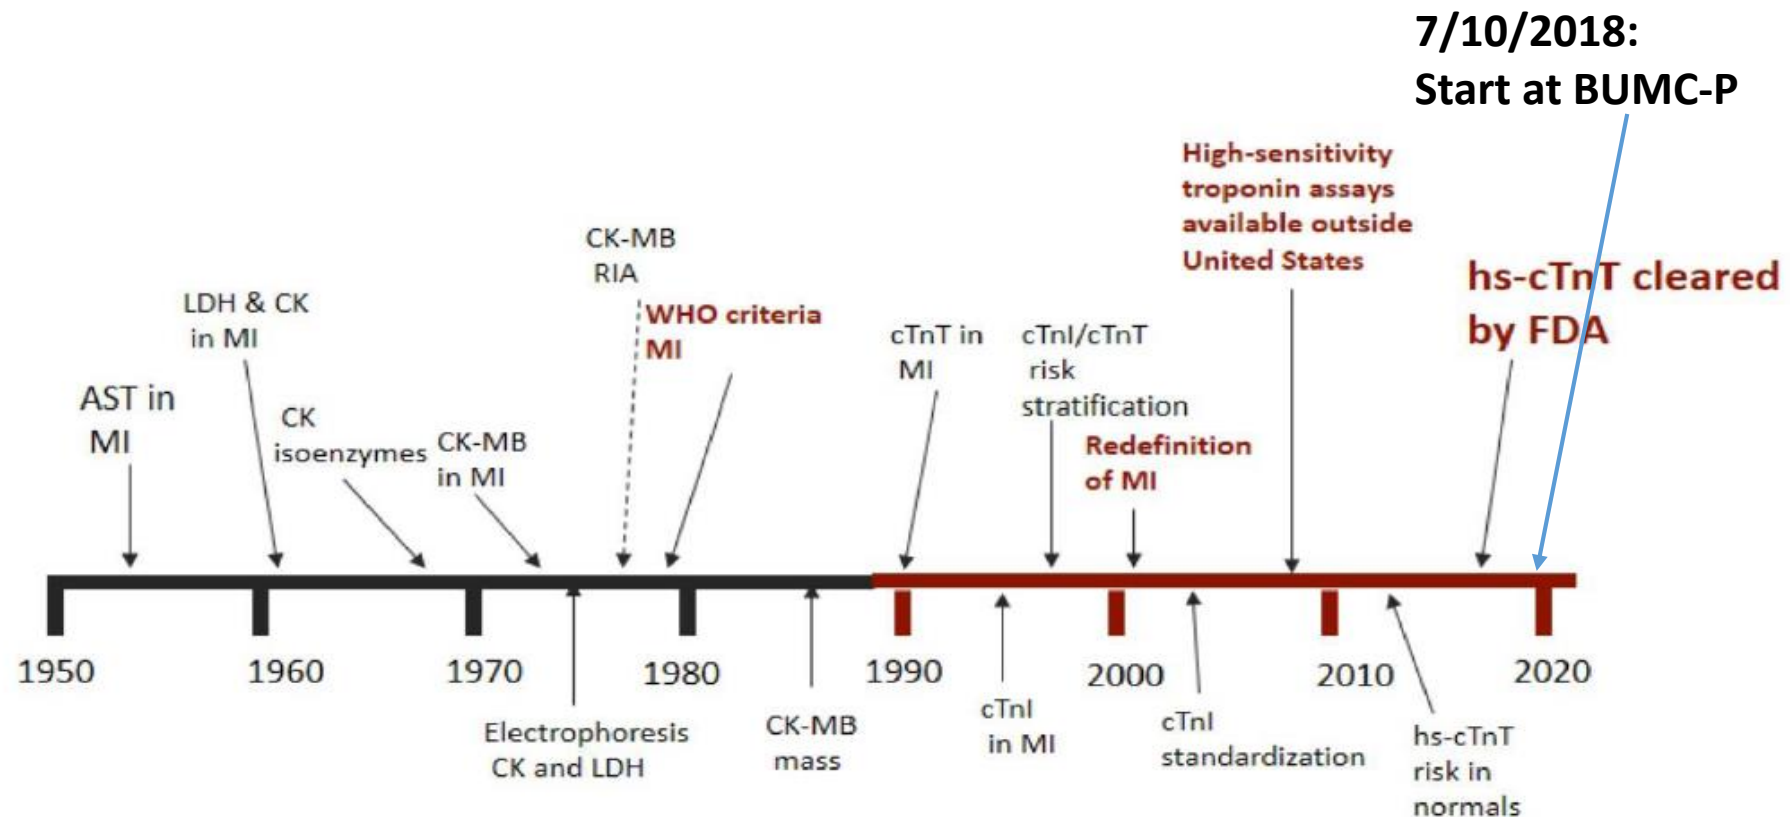

# Classification of Acute MI

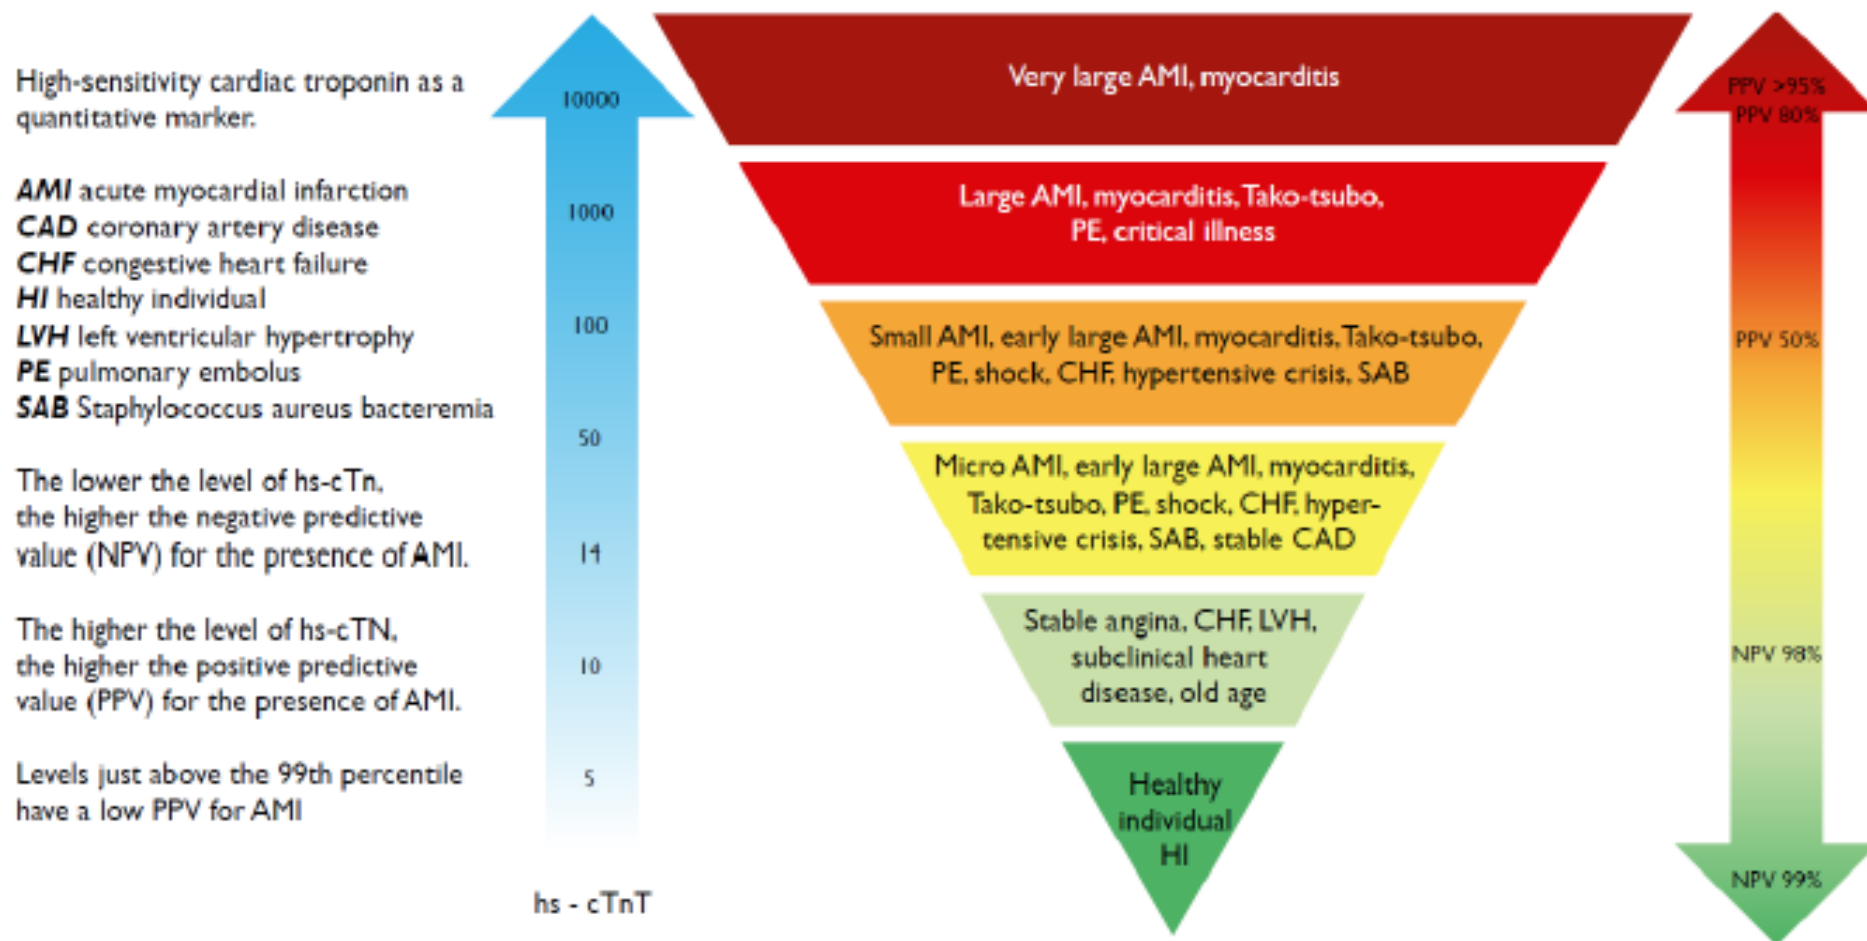

- Type 1:
  - Spontaneous MI related to ischemia due to primary coronary event such as plaque rupture
- Type 2:
  - MI secondary to ischemia due to either increased oxygen demand or decreased supply
- Type 3:
  - Sudden unexpected cardiac death with coronary event prior to troponin evaluation
- Type 4a:
  - MI associated with PCI
- Type 4b:
  - MI associated with stent thrombosis
- Type 5:
  - MI associated with CABG

# HIGH SENSITIVITY-CARDIAC TROPONIN T hs-cTnT

## Necrosis Biomarkers Timeline

# Use in evaluation of suspected ACS

**For STEMI patient– activate CARDIAC ALERT**

Evaluation of chest pain must integrate clinical, EKG, and hs-cTnT information.  
Clinical care must not be based on lab values alone.

**Initial hs-cTnT  
Lab Value**

**Repeat Lab at 2hr**

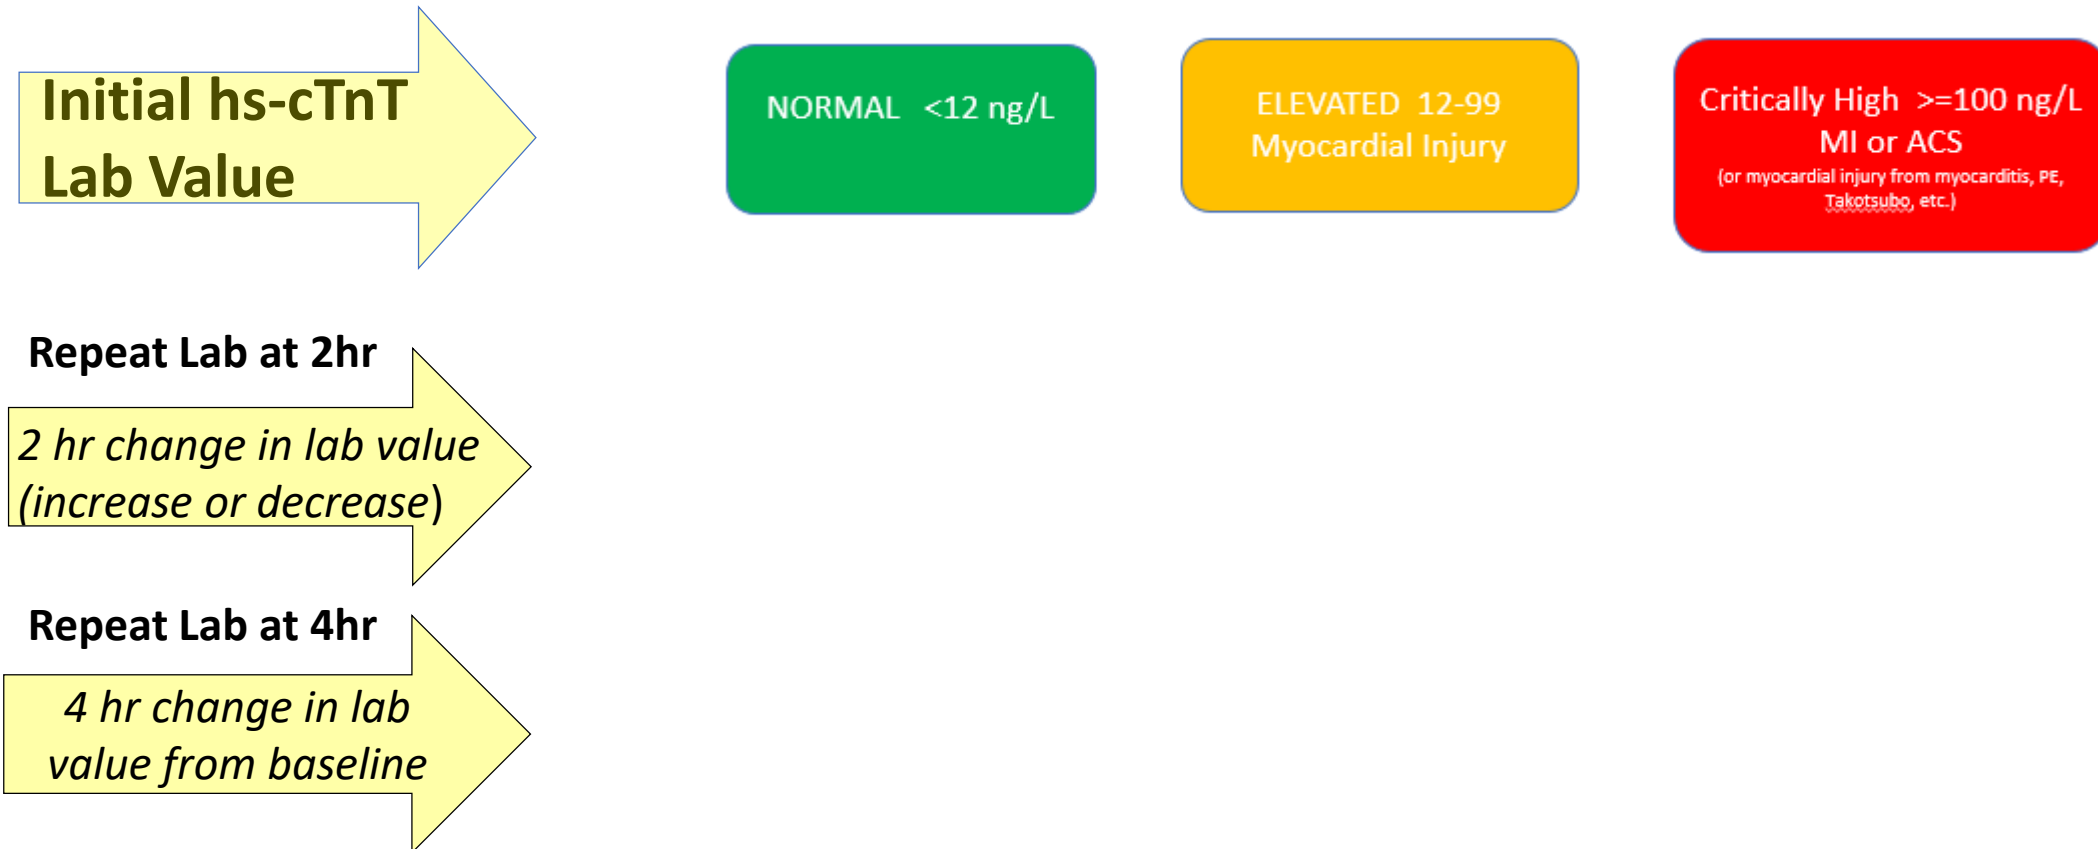

*2 hr change in lab value  
(increase or decrease)*

**Repeat Lab at 4hr**

*4 hr change in lab  
value from baseline*

# For STEMI patient– activate **CARDIAC ALERT**

Evaluation of chest pain must integrate clinical, EKG, and hs-cTnT information.  
Clinical care must not be based on lab values alone.

**For STEMI patient– activate CARDIAC ALERT**

Evaluation of chest pain must integrate clinical, EKG, and hs-cTnT information.

Clinical care must not be based on lab values alone.

**Initial hs-cTnT  
Lab Value**

NORMAL <12 ng/L

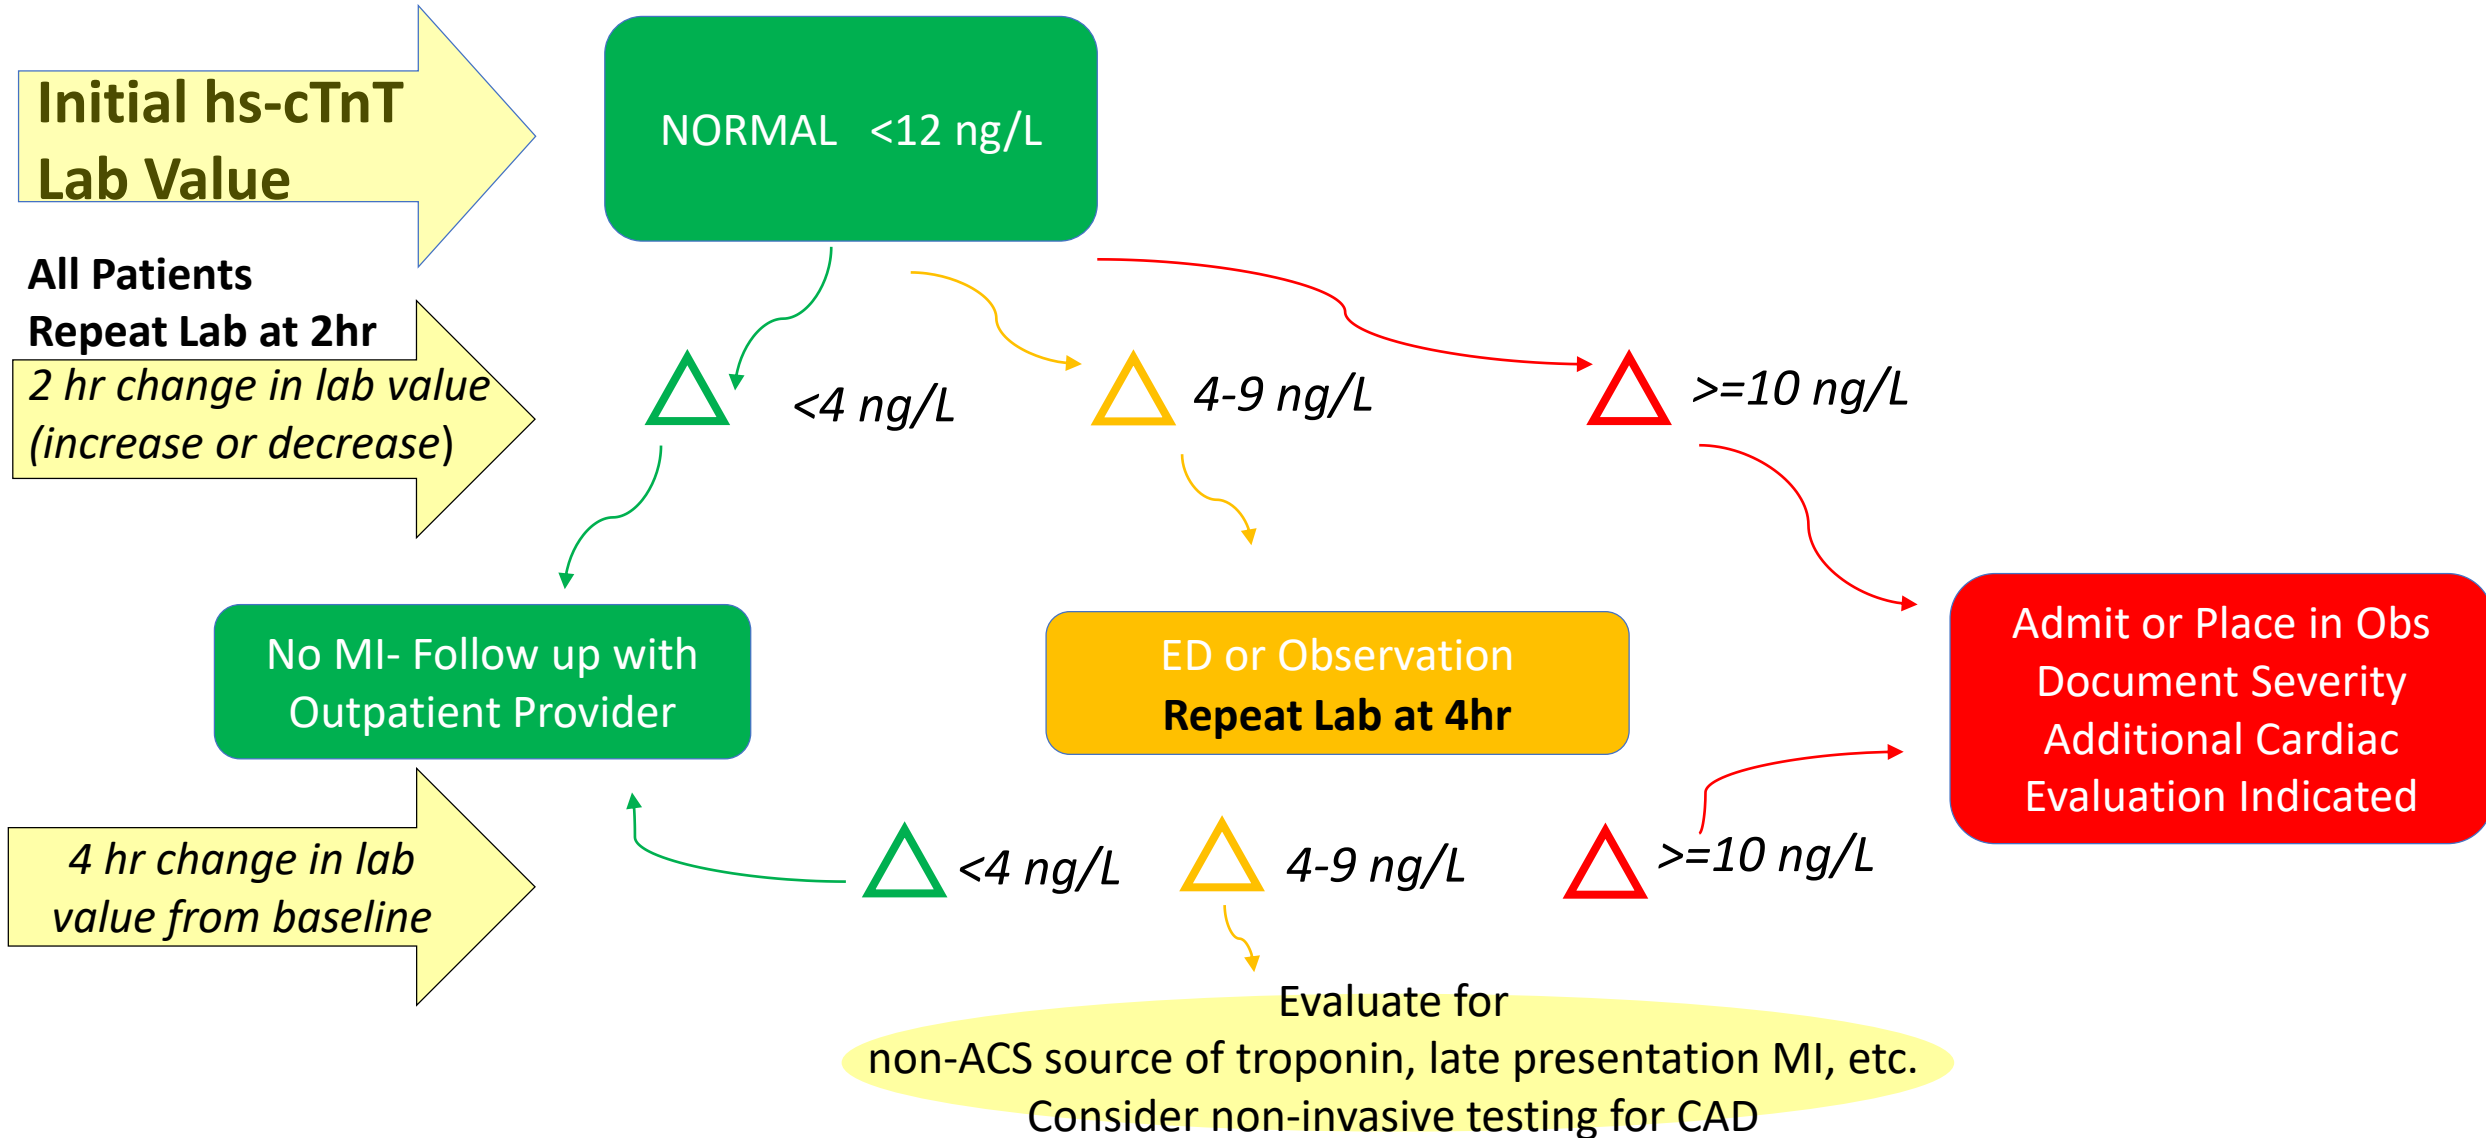

ELEVATED 12-99  
Myocardial Injury

**Critically High  $\geq 100$  ng/L  
MI or ACS**  
(or myocardial injury from myocarditis, PE,  
Takotsubo, etc.)

Admit or Place in Obs
