Arterial

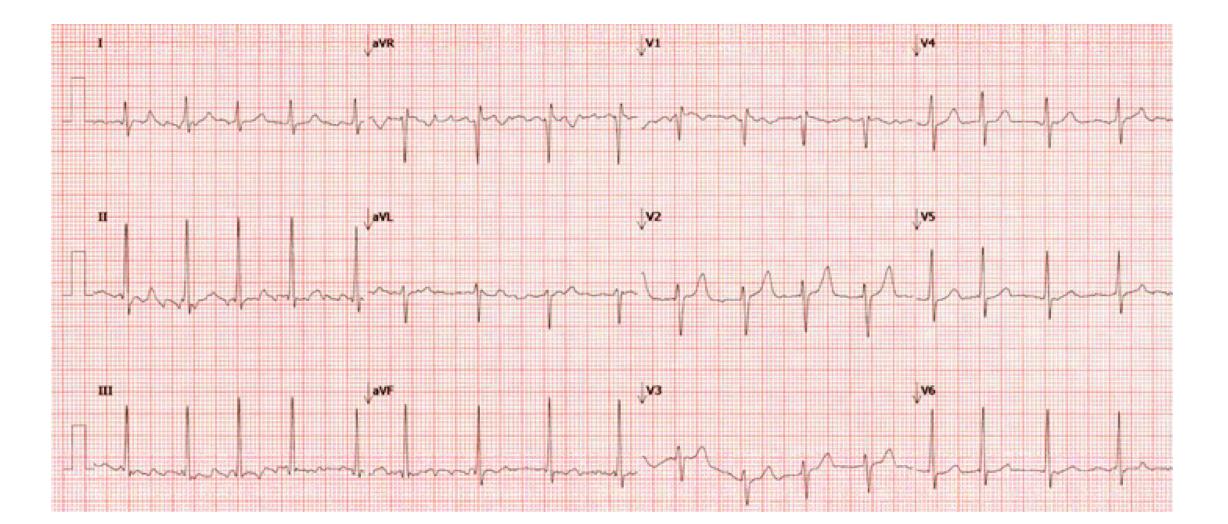

Fibrillation

Dr. Tung

Case scenario

 67 y/o man with DM2 presents to ED with 2 weeks of shortness of breath, LE edema, and PND. No known cardiac history.

EKG diagnosis

- 1. Atrial flutter with variable block
- 2. Atrial flutter with 2:1 block
- 3. Multifocal atrial tachycardia (MAT)
- 4. Atrial fibrillation

Vital/PE/Labs

- HR 150 BP 110/65 92%RA
- JVP angle of jaw, IR S1S2, distant sounds, rales bilaterally, 2+ LE edema
- Na 140 K 3.5
- Cr 1.4

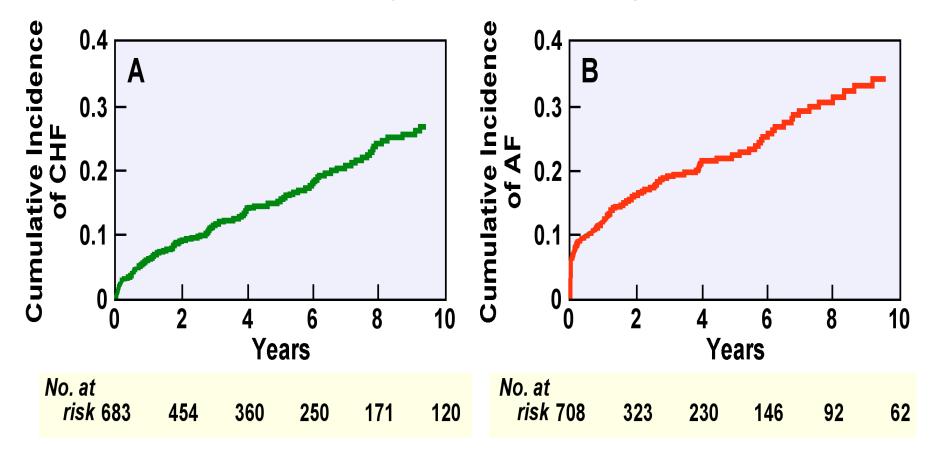

What is best next step in management?

- 1) Immediate cardioversion
- 2) Amiodarone
- 3) Bring to EP lab for ablation
- 4) Class Ic (flecainide, propafenone)
- 5) POCUS

Unadjusted Cumulative Incidence of First CHF in Individuals with AF Unadjusted Cumulative Incidence of First AF in Individuals with CHF

1 in 5 will develop the other at 5 years

Wang et al. Circulation 2003; 107: 2929-2925

Atrial Fibrillation Associated with Poor Prognosis in Chronic Systolic HF

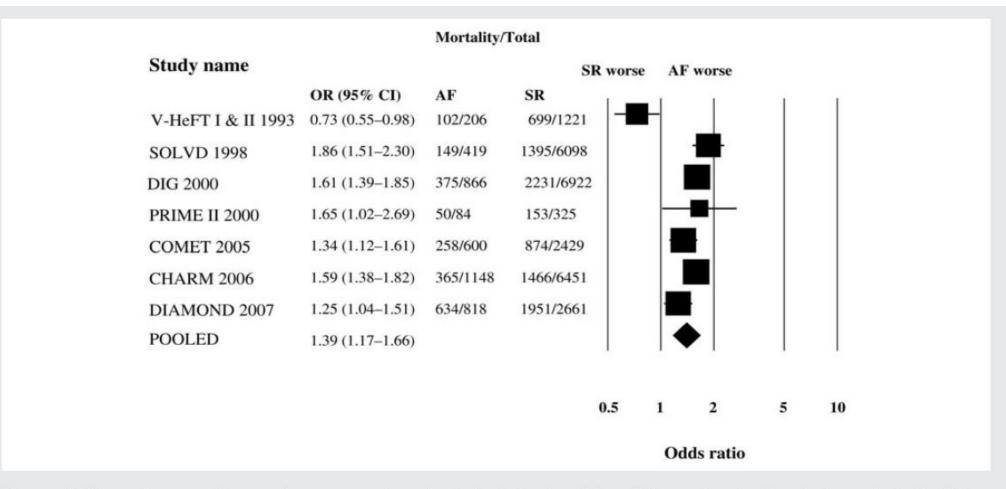

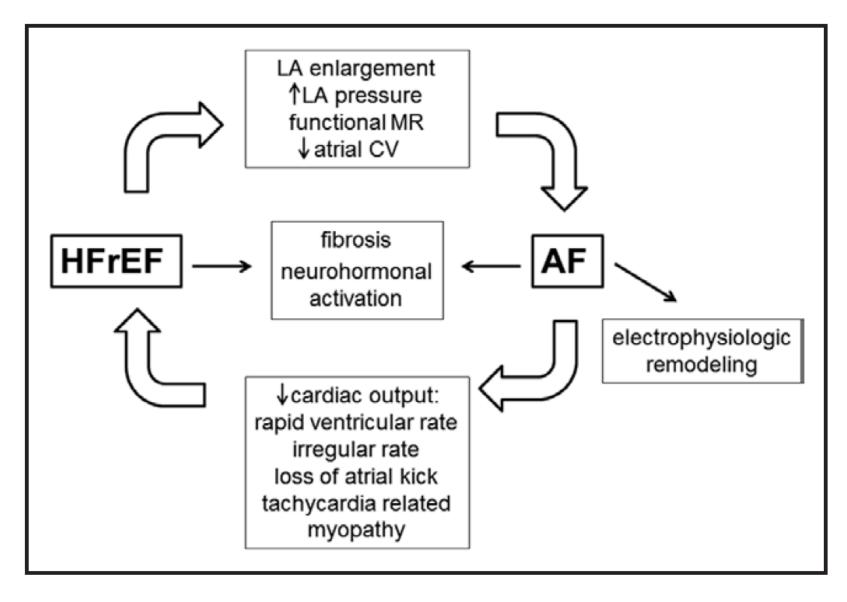

Figure I Forest plot comparing mortality outcomes in randomized trials in chronic heart failure patients in sinus rhythm and atrial fibrillation. Odds ratios and 95% confidence intervals are presented for individual studies and pooled data.

AF and HF: A Vicious Cycle

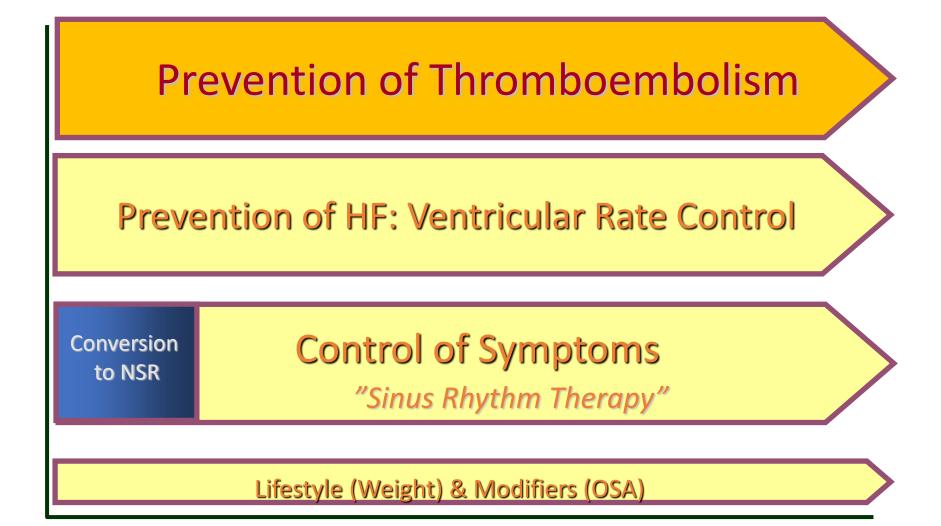

Verma A., et al. *Circulation* 2017;135:1548

What is the most important aspect in AF management?

Approach to Treatment of Atrial Fibrillation

What type of AF does this patient have?

- 1. Paroxysmal
- 2. Chronic
- 3. Persistent
- 4. Long standing persistent
- 5. Permanent

AF Definitions

- Paroxysmal: recurrent, terminates spontaneously within 7 days
- Persistent: episodes lasting > 7 days or require intervention for termination (cardioversion)
 - Long standing persistent: continuous AF > 12 months duration
- Permanent: mutual decision between patient and physician to cease further attempts to restore/ maintain normal sinus rhythm by any means
- AF: AF in the absence of moderate severe mitral stenosis or mechanical heart valve
- Valvular AF: AF in the setting of moderate severe mitral stenosis (potentially requiring surgical intervention) or in the presence of an artificial (mechanical) heart valve
 - Warfarin is recommended

The term nonvalvular is no longer used in the new ACC/AHA/HRS Guidelines

1. January CT, et al. 2019Focused Update on Atrial Fibrillation. https://www.ahajournah.org/doi/suppl/10.1161/CIR.00000000000665.

AF and Stroke Risk

- Development of AF increases stroke risk 5 fold¹
- Recurrence of stroke is 2x greater within 6 months in AF²
- AF promotes stasis of blood, induces structural changes in the LA and induces hypercoagulability³
- The LAA is the most common location for thrombus⁴

^{4.} Mahajan R, et al. Importance of the underlying substrate in determining thrombus location in atrial fibrillation: implications for left atrial appendage. *Heart* 2012;98:1120

What is the patients annual stroke risk?

1%-2%
 3%-5%
 6%-8%
 8%-10%

Assessing Stroke Risk in AF

Criteria		Poss. Point
Congestive heart failure Signs/symptoms of heart failure confirmed with objective evidence of cardiac dysfunction	Yes No	+1
Hypertension Resting BP > 140/90 mmHg on at least 2 occasions <u>or</u> current antihypertensive pharmacologic treatment	Yes No	+1
Age 75 years or older	Yes No	+2
Diabetes mellitus Fasting glucose > 125 mg/dL or treatment with oral hypoglycemic agent and/or insulin	Yes No	+1
Stroke, TIA, or TE Includes any history of cerebral ischemia	Yes No	+2
Vascular disease Prior <u>MI</u> , peripheral arterial disease, or aortic plaque	Yes No	+1
Age 65 to 74 years	Yes No	+1
Sex Category (female) Female gender confers higher risk	Yes No	+1

Table 2 Stroke or thromboembolism/100 years at risk in relation to CHADS₂ and CHA₂DS₂-VASc scores in 90 490 patients without warfarin throughout follow-up

	n	Ischaemic stroke		Stroke/TIA/perip	heral emboli

All	90 490	4.5	5.0	6.2	7.0

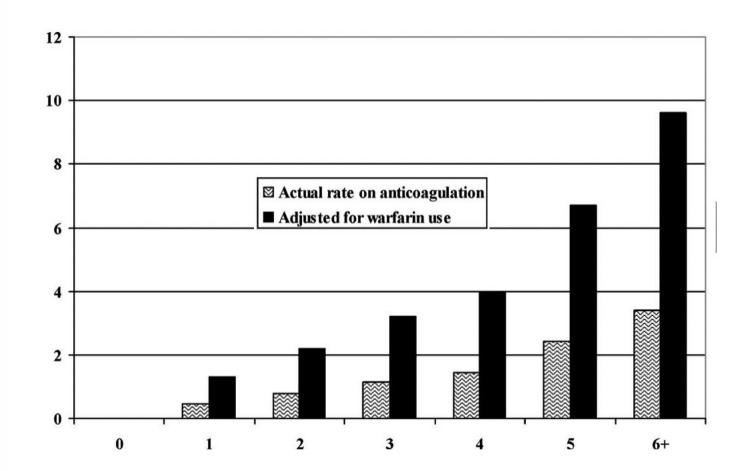

^aAdjustment made for exposure to aspirin treatment, assuming that aspirin provides a 22% reduction in TE risk, to give an indication of 'untreated' rates. For abbreviations and details on risk schema, see text.

Predicting Stroke Risk by CHA2DS2VASC

Table 4.Stroke or Other Thromboembolism Events perPatient Year Based on the CHA2DS2VASc Scoring System

CHA ₂ DS ₂		No. of TE	TE Rate During	TE Rate During 1 Year, Adjusted
VASc Score	Ν	Events/PY	1 Year (95% Cl)	for Warfarin use*
0	1	0/2	0.00	0.0
1	422	3/653	0.46 (0.10, 1.34)	1.3
2	1230	15/1913	0.78 (0.44, 1.29)	2.2
3	1730	31/2673	1.16 (0.79, 1.64)	3.2
4	1718	38/2665	1.43 (1.01, 1.95)	4.0
5	1159	42/1732	2.42 (1.75, 3.26)	6.7
6	679	36/1016	3.54 (2.49, 4.87)	9.8
7	294	15/436	3.44 (1.94, 5.62)	9.6
8	82	3/125	2.41 (0.53, 6.88)	6.7
9	14	1/18	5.47 (0.91, 27.0)	15.2
Total	7329	184/11233	P value for trend	<i>P</i> <0.0001

*Theoretical TE rates without therapy: assuming that warfarin provides a 64% reduction in TE risk, based on Hart et al.³⁴ Cl indicates confidence interval.

Who should receive long-term anticoagulation?

Patient Profile	Recommendation (Class of Recommendation, Level of Evidence)
AF and CHA ₂ DS ₂ -VASc score = 0 in men or 1 in women	It is reasonable to omit oral anticoagulant therapy (IIa, B)
AF and CHA_2DS_2 -VASc score ≥ 2 in men	Oral anticoagulants are recommended (I, A & B)
AF and CHA_2DS_2 -VASc score ≥ 3 in women	Oral anticoagulants are recommended (I, A & B)

Dealer's Choice: What to do about CHA2DS2VASc 1?

January CT, et al. 2019 Focused Update on Atrial Fibrillation. https://www.ahajournals.org/doi/suppl/10.1161/CIR.00000000000665.

What is idealized rate control?

1. 60 bpm
 2. 80 bpm
 3. 100 bpm
 4. 110 bpm

Life-threatening adverse effect of rate-control drugs	3 (1.1)	2 (0.7)			
Sustained ventricular tachycardia or ventricular fibrillation	0	1 (0.3)			
Cardioverter-defibrillator implantation	0	1 (0.3)			
Pacemaker implantation	2 (0.8)	4 (1.4)			

Which AAD is best in HF?

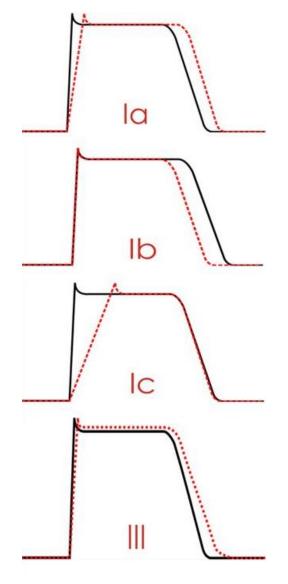

- 1. Dronedarone
- 2. Flecainide
- 3. Amiodarone
- 4. Lidocaine

Anti-arrhythmic drugs for AF

Vaughan-Williams Classification

IAICIIIQuinidineFlecainideSotalolProcainamidePropafenoneAmiodaroneDisopyramideDofetilide

Dronedarone

Beta Blockers

IV Calcium Channel Blockers

Antiarrhythmic Drug: Side Effects

- Quinidine: diarrhea, fever, rash, thrombocytopenia, granulomatous hepatitis, tinnitus, torsades
- Procainamide: vomiting, rash, lupus (~10%), agranulocytosis, torsades
- Disopyramide: anticholinergic effects; negative inotropic effects, VT, torsades
- Flecainide/propafenone : pro-arrhythmia wide complex tachycardia- QRS prolongation
- Sotalol/Ibutilide/Dofetilide: pro-arrhythmia torsades
- Amiodarone: liver, lung, thyroid, skin, neurological and eye toxicity

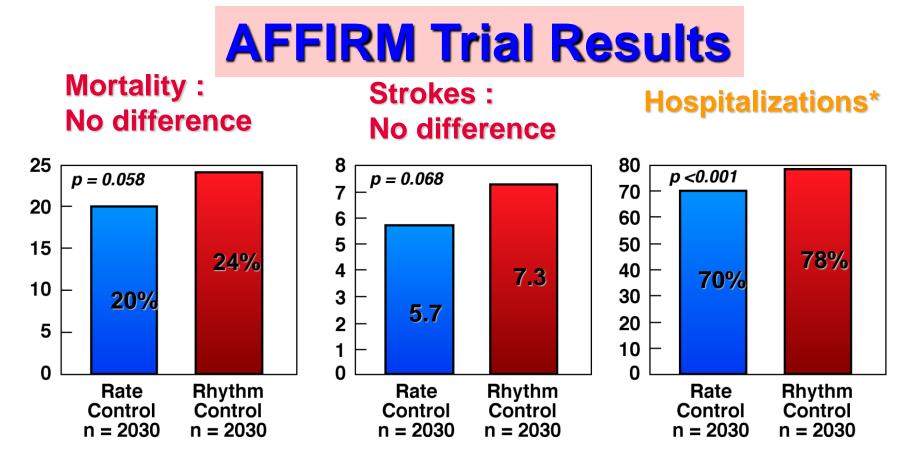

Does rhythm or rate control have survival advantage?

Atrial Fibrillation: Rate Control versus Rhythm Control Trials

	PIAF STAF		RACE	AFFIRM
n	252	200	522	4060
Follow-up (range)	1 year	19.6 months (0-36)	2.3 year	3.5 years (3.5-6)
Mean age (years)	61.5	65.8	68	69.7
Duration of AF	< 360 days	< 2 years	< 1 year	< 6 months
Important inclusion	Symptomatic	Moderate risk of	1-2 previous	High risk of AF
criteria	patients	AF recurrence	DCC within 2 years	recurrence
Primary endpoint	Symptom improvement	Composite ^a	Composite ^b	Overall mortality
Rhythm control	55.1%	10%	22.6%	23.8% (at 5 years)
Rate control	60.8%	9%	17.2%	21.3% (at 5 years)
p (primary end point)	0.317	0.99	0.11	0.08

^a Combination death, stroke or transient ischemic attack, cardiopulmonary resuscitation, or systemic embolism

Death from cardiovascular causes, heart failure, thromboembolic complications, bleeding, implantation of a pacemaker, and sever adverse effects of anti-arrhythmic drugs

4,060 patients; enrolled 1995-99; age > 65 yrs or <65 yrs with HTN, CHF; AF duration > 6 hours

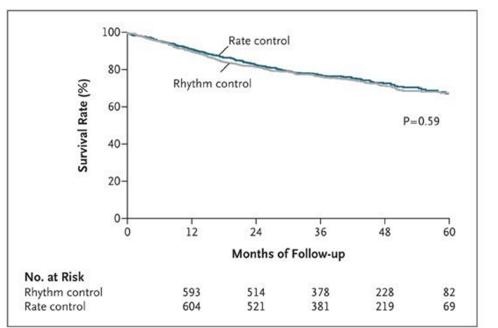

PRIMARY ENDPOINT: Mortality; Secondary endpoints: stroke, QOL **RATE CONTROL:** Digoxin 51%, beta blockers 49%, Calcium channel blocker 41%, ablate and pace 5%

RHYTHM CONTROL: Amiodarone 39%, Sotalol 33%, Propafenone 10%,

Procainamide 5%, Quinidine 5%.

1376 patients with HF randomized to rate vs rhythm control

80% of patients treated with amiodarone

Amiodarone resulted in

- ↑ maintenance of NSR
- No effect on mortality
- No effect on HF outcomes
- Intermittent ECGs were used to assess NSR
- CA not utilized
- Advanced AF population

* Plus-minus values are means ±SD. NYHA denotes New York Heart Association.

[†] The body-mass index is the weight in kilograms divided by the square of the height in meters.

Race was self-reported.

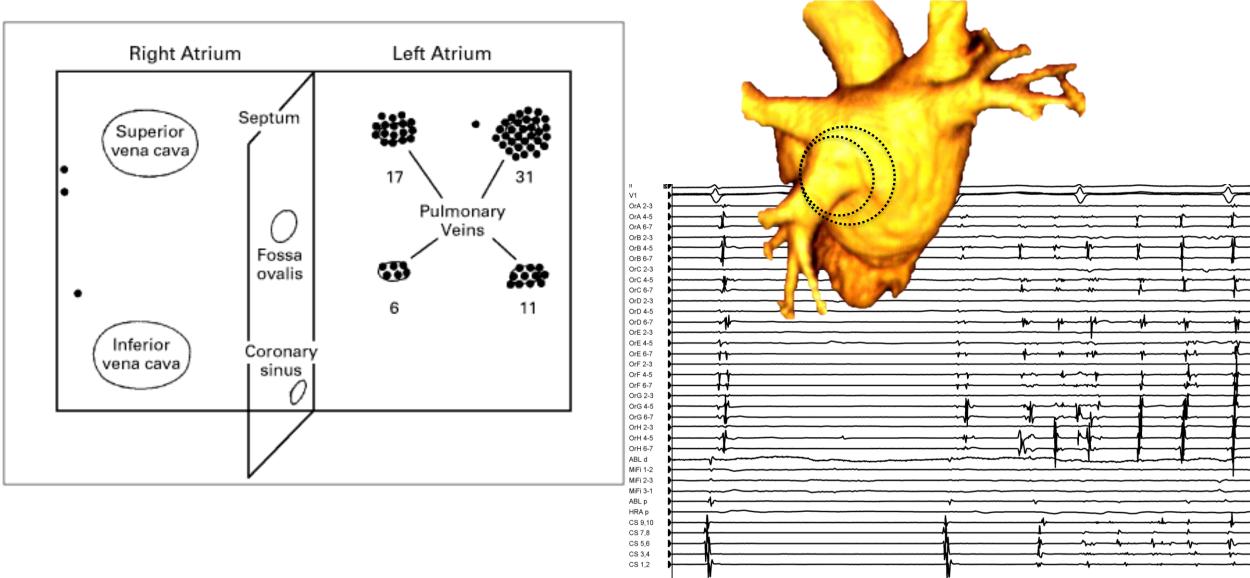

Conditions in this category were determined by the investigator to be the predominant underlying cause of left ventricular systolic dysfunction.

Atrial fibrillation was defined as persistent if the termination of most episodes required drug therapy or electrical cardioversion.

Does the patient meet indication for catheter ablation?

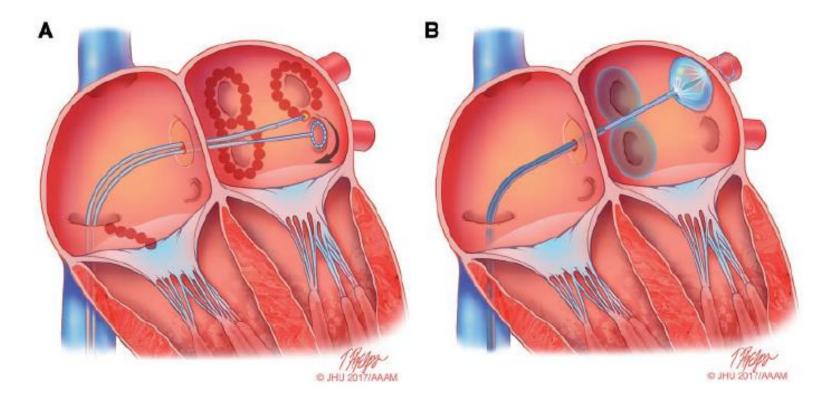

'Focal' Atrial Fibrillation Ablation

Haissaguerre et al. NEJM 1998,338:659-666

Catheter Ablation for AF

Energy sources may vary based on operator experience, preference, perceived complications and results, its clear that the goal is complete and verifiable pulmonary vein isolation with demonstration of entrance block.

2017 HRS/EHRA/ECAS/APHRS/SOLAECE expert consensus statement on catheter and surgical ablation of atrial fibrillation. *Europace* 2018 (20): 157-208
